

# APOLLO CLIENT SETUP

in this GraphQL tutorial I'll show you how to set up React with GraphQL using Apollo. Apollo helps our front-end app to generate queries to our server, and receive the data back.

# Apollo Client Setup

In the Terminal write nest command:

- `npm install @apollo/client graphql`

App.js

```
import React, { Component } from 'react';
import { ApolloClient, ApolloProvider } from "@apollo/client";
```

```
// components
import BookList from './components/BookList';
```

```
// apollo client setup
const client = new ApolloClient({
  uri: 'http://localhost:4000/graphql'
});
```

```
class App extends Component {
  render() {
    return (
      <ApolloProvider client={client}>
        <div id="main">
          <h1>My Reading List</h1>
          <BookList />
        </div>
      </ApolloProvider>
    );
  }
}
```

```
export default App;
```

Remove  
code
