# BOOK LIST COMPONENT

In this GraphQL tutorial we'll create the backbone of our Book List component, and est it in our root App component.

Create folder 'components' into the folder src

Create file 'BookList.js' into the folder 'components'

```javascript
import React, { Component } from 'react';

class BookList extends Component {
    render(){
        return(
            <div>
                <ul id="book-list">
                    <li>Book name</li>
                </ul>
            </div>
        );
    }
}

export default BookList;
```

```javascript
import React, { Component } from 'react';

// components
import BookList from './components/BookList';

class App extends Component {
  render() {
    return (
        <div id="main">
          <h1>My Reading List</h1>
          <BookList />
      </div>
    );
  }
}

export default App;
```

# My Reading List

- Book name
